                        -i-FUNCTION: Potently contract gastrointestinal (GI) smooth muscle.
Induces proliferation, migration and fenestration (the formation of membrane discontinuities) in capillary endothelial cells derived from endocrine glands. Has little or no effect on a variety of other endothelial and non-endothelial cell types.
--i-SURCELLUIAR LOCATION: Secreted protein.
--i-SINELSUE SPECIFICITY: Expressed in the steroidogenic glands, ovary, testis, adrenal and placenta.
--i-SIMILARITY: Belongs to the prokinecitin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Mol. Biol. 283:205-219(1998).

-! FUNCTION: Potently contracts gastrointestinal (GI) smooth muscle. May act on potassium channels, but not on Kv1.1, Kv1.2, Kv1.3, Kv1.4, Kv1.5, Kv2.1, Kv3.4, Kv1.2, TREK-1, HERG, KCNQ1, KCNQ2, KCNQ3, IRK1, IRK2, ROMK1, GIRK1, 2 and GIRK1, 4.

-: SUBCELLUIAR LOCATION: Secreted protein.

-: SIMILARITY: Belongs to the prokinecitin family.
"MIT1, a black mamba toxin with a new and highly potent activity on incestinal contraction."; FEBS Lett. 461:183-188(1998).

suprachiasmatic nucleus.";
Nature 477:465-410(2002).
-!- FUNCTION: May function as an output molecule from the
suprachiasmatic nucleus (SCN) that transmits behavioral circadian
rhythm. May also function locally within the SCN to synchronize
output. Potently contracts gastrointestinal (GI) smooth muscle (By
similarity).
                                                                                                          -!- SUBCELULLAR LOCATION: Secreted protein (By similarity).
-!- TISSUE SPECIFICITY: Expressed at high levels in testis and at lower levels in brain, lung, ovary, spleen, thymus and uterus.
-!- INDUCTION: Activated by CLOCK and BMAL1 heterodimers and light; inhibited by period genes (PER1, PER2 and PER3) and cryptochrome genes (CRY1 and CRY2) (Probable).
-!- SIMILARITY: Belongs to the prokinecitin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;
